

Venkata Sai Chandradeep Telaprolu

Technical Product Manager | AI Systems | Data Platforms

chandradeepsai.mba@gmail.com | 502-298-6263 | [linkedin.com/in/sai-telaprolu](https://www.linkedin.com/in/sai-telaprolu) | saitelaprolu.com

Technical: Python · SQL · PySpark · REST APIs · Amazon Redshift · Apache Airflow · LLM Tool-Calling (Gemini API) · RBAC/IAM Frameworks

SUMMARY

Technical Product Manager and builder who lives at the intersection of core platform infrastructure and practical AI engineering. My focus is on turning complex, messy operations into scalable platforms, whether that's leading a cross-functional squad of 18 engineers at JPMorgan to rebuild a multi-tenant enterprise intake system, or hands-on coding an autonomous AI agent layer from scratch. I specialize in architecting decoupled workflow engines and metadata-driven architectures that eliminate redundant engineering work, drive down processing latency, and maximize straight-through processing.

CORE COMPETENCIES

Platform Engineering: Multi-Tenant Architecture, API Contract Design, Workflow Orchestration, RBAC/IAM Frameworks

AI Systems Design: Agentic AI Workflows, LLM Tool-Calling, Retrieval-Augmented Generation (RAG)

Data Growth & Analytics: Funnel Telemetry, A/B Testing, Data Pipeline Engineering

PROFESSIONAL EXPERIENCE

Technical Product Manager, JPMorgan Chase & Co.

Apr 2024 – Present

Lead platform strategy for a large-scale, multi-tenant onboarding system serving over 180 enterprise accounts.

- Orchestrated platform strategy and directed a cross-functional squad of 18 software engineers and 4 management consultants to scale a multi-tenant enterprise onboarding engine from 45 to 180+ accounts across 15 back-office payment integrations (Wires, ACH, RTP).
- Delivered a generative AI authoring tool from concept to production, enabling non-engineers to manage complex configuration changes and reducing engineering tickets by 80%.
- Redesigned core platform APIs and validation logic, reducing processing latency from 72 hours to under one hour and decreasing error rates by 90% across the network.
- Architected a unified, reusable schema layer, enabling a "publish once, reuse everywhere" model and eliminating redundant engineering builds across 68 distributed teams.
- Built automated workflow routing logic within the Catalog layer, dynamically directing onboarding requests to the correct validation and approval paths based on client type and product mix.
- Led adoption strategy for over 1,500 platform users through structured experimentation, telemetry analysis, and iterative rollout planning.
- Presented roadmap and risk updates directly to senior leadership each quarter, a key factor in securing engineering headcount across three consecutive release cycles.

Technical Product Manager, Data Platforms, JPMorgan Chase & Co.

Aug 2022 – Mar 2024

Built a governed, cloud-native data platform to replace a fragmented manual reporting infrastructure.

- Architected a scalable, event-driven data pipeline to ingest multi-tenant source banking records into Amazon Redshift, establishing an enterprise single-source-of-truth layer.
- Ran discovery sessions with 10+ sales leaders and data science stakeholders to define requirements, translating findings into a spec covering ingestion, modeling, and access control.
- Designed multi-tenant RBAC/IAM and row-level security frameworks; the governance model was later adopted by two additional platform teams as a company-wide standard.
- Executed a strategic pivot prioritizing data reliability engineering over feature velocity after logging telemetry that isolated trust as the primary adoption blocker, driving a 35% lift in daily active usage (DAU) the following quarter.

Product Manager, Yum! Brands

Oct 2021 – Jun 2022

Owned the checkout experience for KFC, Pizza Hut, and Taco Bell's digital ordering platform, supporting over 50 million transactions annually.

- Instrumented end-to-end funnel telemetry across web and mobile ordering frameworks to isolate payment gateway latency vectors and checkout transaction abandonment patterns across 50M+ annual runs.
- Executed systematic A/B tests on checkout error handling and retry logic, directly informing the engineering release roadmap.
- Collaborated with core engineering squads to build a real-time analytics diagnostics dashboard, reducing Mean Time to Detection (MTTD) for checkout payment gateway anomalies by 85%.

Data & Analytics Engineer, Reguss Consulting

Jun 2020 – Oct 2021

- Built predictive lead-scoring models and automated ETL reporting pipelines (SQL, PySpark, Airflow), reducing manual reporting time by 30% and transitioning sales leaders from manual Excel tracking.
- Developed KPI hierarchies and scorecards for marketing and sales stakeholders, moving teams from ad-hoc reporting to a standardized, automated analytics workflow.

Business Development Intern, Dell Technologies

Jan 2019 – Jan 2020

- Supported TAM/SAM sizing and territory planning; built weekly pipeline and forecast views in Excel and Power BI to improve stage hygiene and CRM data accuracy.
- Produced win/loss analyses, battlecards, and ROI inputs to enhance sales messaging for the regional sales team.

TECHNICAL INNOVATION & AI R&D

Feedback-to-Backlog AI Copilot

June, 2026 – Present

- Architected an AI-powered feedback-to-backlog pipeline that extracts, deduplicates, and prioritizes customer signals using a hybrid fuzzy/semantic matching engine and a fully explainable RICE scoring model, cutting manual triage effort and syncing results directly to Jira via REST API.
- Built and validated a labeled 40-ticket evaluation harness to benchmark extraction accuracy and deduplication precision/recall, replacing assumed quality targets with measured, defensible performance metrics.
- Shipped a production-style Streamlit dashboard with real-time priority trend tracking, bulk Jira sync with isolated failure handling, and transparent AI guardrails designed for zero silent failures and full score traceability end-to-end.

ApexApply — Autonomous AI Agent Platform

2026 – Present

- Designed and launched an autonomous agent (Python, Gemini API) that analyzes dynamic web interfaces, classifies UI elements in real time, and independently executes multi-step actions.
- Engineered a persistent memory architecture enabling the agent to retain context across long-running, multi-stage workflows, mirroring production-grade agentic system design.
- Built a complete four-module system architecture, including logging, state management, and a review dashboard to track agent performance.

EDUCATION

MS, Business Analytics · University of Louisville

B.Tech, Computer Science · Bharath University
